### **Project Title – "Smart Subscription Tracker"**

Phase 8: Data Management & Deployment

### **Data Import Wizard-**

In Salesforce (Lightning): click Setup ( ( ).

Quick Find  $\rightarrow$  type Data Import Wizard  $\rightarrow$  click it.

Click Launch Wizard (or Open Data Import Wizard).

Scroll to the relevant object area: choose Standard Objects or Custom Objects  $\rightarrow$  Subscription\_\_c.

Choose the action: Add new records, Update existing records, or Add new and update existing.

Upload your CSV file for the object you selected.

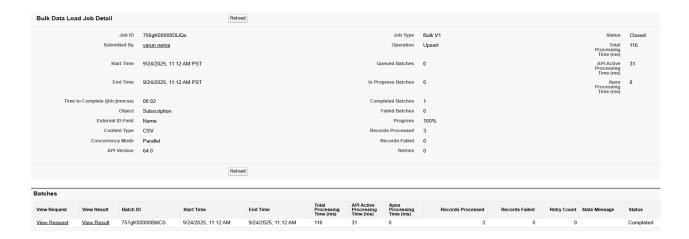

Field mapping & lookups

After upload the wizard auto-maps columns to fields. Verify each mapping.

For Account lookup on subscriptions, map your CSV column Account\_External\_ID\_\_c to Account → External\_ID\_\_c (or to Account Id if you used Salesforce Ids).

Double-check date, picklist and number mappings.

When ready, click Start Import (or Next  $\rightarrow$  Start Import).

# **Data loader-**

#### > Data export

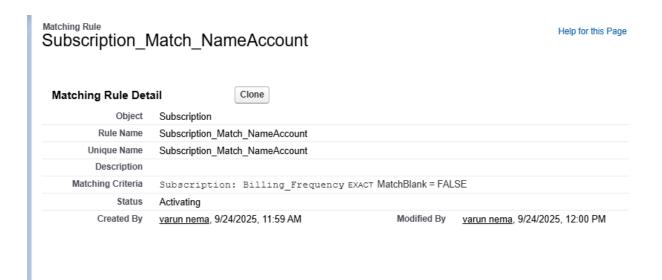

- In Data Loader choose **Export**.
- Select object Account.
- Click **Browse...** to choose a CSV output path.
- Use SOQL query or select fields: Id, Name (or Id, Name, BillingCity if helpful).
- $\bullet$  Click **Next**  $\rightarrow$  **Finish**. Open the CSV and match names to Ids for use in the Subscriptions file.

Record ID	Account	Discountc	End Date	Price	Start Date	Status

- Matching rule
- Setup → Quick Find → Duplicate Management → Matching Rules.
- Click New Rule.
- Select Object = subscription\_c.
- Give it a Label: subscription\_Match\_NamePhone. Add a short description.
- Add matching criteria:
- Field: Account: Name → Matching Method: Fuzzy (or "Approximate/Name" if shown).
- Add another criterion: Account: Phone → Matching Method: Exact.
- Save → then Activate the matching rule (must be active before it's used by a Duplicate Rule).

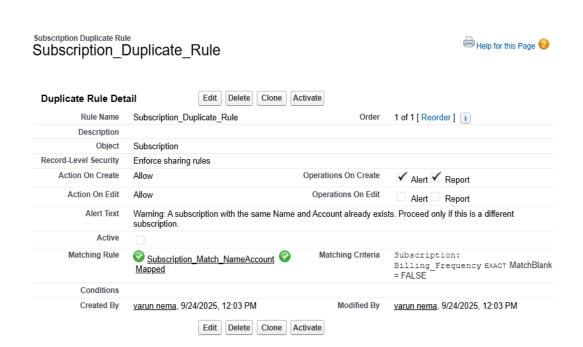

### **Duplicate Rule (example: subscription)**

Setup → Duplicate Management → Duplicate Rules → New Rule

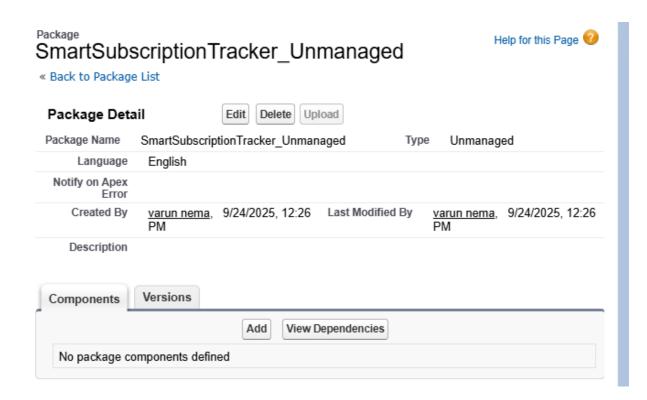

- 1. Object: Subscription c.
- 2. Rule Name: Subscription Duplicate Rule (or similar).
- 3. Matching Rule: add the Subscription\_Match\_NameAccount matching rule you just created.
- 4. Action on Create: Allow (this lets bulk imports proceed; keeps record creation from being blocked).

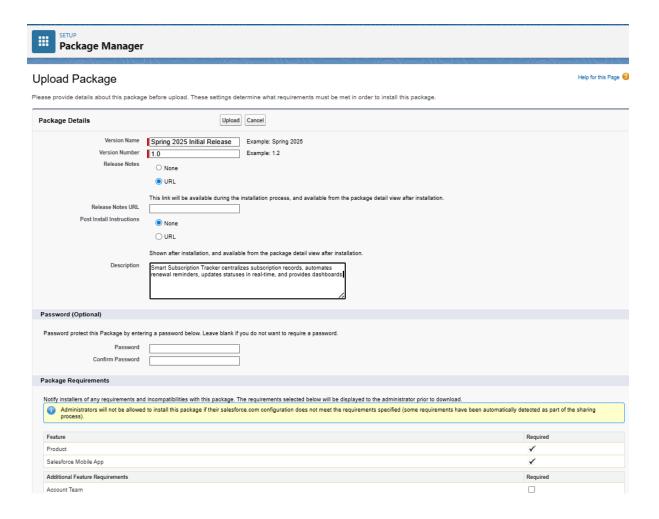

- Optionally Action on Edit: set to Allow (or Block if you want stricter editing controls).
- 5. Create Duplicate Record Sets (or "Report duplicates" / enable the option that records duplicates): enable this so Salesforce will create *Duplicate Record Set* entries you can review later.
- 6. Alert Text (optional) enter a short message to show users during UI creation, for example:
  - "Warning: A subscription with the same Name and Account already exists. Proceed only if this is a different subscription."
    - This will display when a user tries to create a possible duplicate in the Lightning UI while still allowing the save (because Action on Create = Allow).
- 7. Save  $\rightarrow$  Activate the duplicate rule.

# Unmanaged vs Managed Packages

- 1. Go to Setup → Quick Find: "Packages" (or "App Manager / Packaging").
- Click New → give the package a name (e.g., SmartSubscriptionTracker\_Unmanaged)
  → Save.
- 3. Open the package and click Add → add components: Custom Object Subscription\_\_c, fields, Apex classes, flows, permission sets, matching & duplicate rules, reports, dashboards, etc. Add everything your app needs.
- 4. Click Upload → choose Unmanaged (if UI asks) → Upload. Wait until upload completes.
- 5. Once uploaded, get the Install URL from the package detail page and share with target orgs. Test install in a clean Dev org.
- 6. After install, run post-install checklist: assign permission sets, check duplicate rule behavior, run automation.

## Change Sets

Change Sets are primarily utilized for migrating customizations and configurations between interconnected Salesforce environments, such as from a Sandbox to a Production instance. Since this project was developed entirely within a single Developer Org, environment-to-environment deployment was not required, and therefore Change Sets were not applied.

## **ANT Migration Tool**

The ANT Migration Tool is a command-line—based deployment framework intended for use in large-scale projects, particularly where continuous integration and automated deployments are required. As this project was undertaken as an individual academic build within a single environment, the need for such advanced deployment automation did not arise, and the ANT Migration Tool was not employed.

## **♣** <u>VS CODE & SFDX</u>

Setting Up the VS code for the Salesforce:

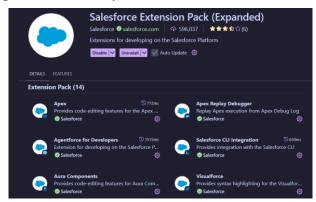

#### 1. Installing JDK (Java Development Kit )

Linux macOS Windows		
Product/file description	File size	Download
x64 Compressed Archive	204.30 MB	https://download. 25_windows-x64_
x64 Installer	182.25 MB	https://download. 25_windows-x64_
x64 MSI Installer	181.02 MB	https://download. 25_windows-x64_

2. Installing Salesforce CLI for integration

3. Installing the necessary extensions in VS Code:

4. Authorizing the salesforce org with vs code
